Get ready to Sleip

Quick guide on how to record with the Sleip app

Before you begin

Requirements

- iPhone
- Internet connection
- Sleip app downloaded and account activated

Recommendations

An iPhone 12 or later model is recommended as these have three cameras as illustrated above. Additionally, using a tripod (with a universal iPhone mount) increases the quality of the recording making analysis processing quicker. It also allows you to focus on the horse rather than on the camera!

Setting up to record

Preparing the camera

- Set up in a well-lighted environment with a flat surface, outdoors or indoors
- Make sure there are no other horses in camera view
- Avoid strong direct sunlight in the camera
- Position the phone in landscape mode and at eye level

Preparing the horse

- · Get the horse familiar with the environment
- Avoid environments where the horse can get distracted

Getting started with the Sleip app

- Sign in with your e-mail and password
- Select a horse from the list or press + in the upper corner to add a new horse

Start a recording

- Press Record video on the horse's profile page
- Select either Straight line recording or Longeing
- The app will switch to camera mode and you are ready to start recording

How to Sleip on a straight line

Trot the horse back and forth **twice** in the same recording. Start just in front or right beside the camera.

- · Press the red button to start recording
- Trot the horse away from the camera for about 30m (as for a visual exam)
- Turn the horse around and trot back towards the camera
- Repeat record the horse trotting away and back again.
- When the recording is complete, press the red button to stop and upload the video

Keep in mind for straight line recordings

- Maintain a steady trot
- Make sure the handler runs beside the horse and not in front of it
- Give the horse's head enough freedom to move
- Ensure that all the horse's limbs are visible throughout the entire recording

The analysis is ready to view within a few minutes, depending on your internet connection.

You'll receive a push notification on your phone once it's done.

How to Sleip longeing

Longe the horse in **two separate recordings**, one for each direction.

- Longe the horse trotting for about 45 seconds in one direction
- Once you finish longeing in one direction, stop the recording and upload the video
- Turn the horse around and start a new recording while longeing in the other direction
- When the second recording is complete, press the red button to stop and upload the video

Keep in mind for longeing recordings

- The diameter of the longeing area should be around 10m for the best results
- Make sure to keep the same circle size in both directions
- The phone should be set up about 10m from the edge of the longeing circle to cover the longing area and the horse entirely
- If you longe the horse in a bullet pen, make sure the fence is not in front of the camera
- Keep the entire horse in camera view. You may need to turn the phone slightly to follow the horse

The analysis is ready to view within a few minutes, depending on your internet connection.

You'll receive a push notification on your phone once it's done.

Slow internet connection?

If you have a slow internet connection, simply save the recording and upload it for analysis once you have better connectivity, as follows:

- When the recording is complete, press Stop and then Continue
- Choose to Save locally
- Locally saved recordings will appear in the horse's profile under Waiting for upload Upload for analysis once your internet connection allows
