

Get ready to Sleip

Quick guide on how to record with the Sleip app

Requirements

- iPhone 12 Pro or newer iPhone Pro model (iPhones with 3 cameras)
- Sleip app downloaded and account activated

Recommendations

- Tripod that extends to eye level height
- Universal iPhone tripod mount

A tripod is recommended as it increases the quality of the recording making the uploading for analysis quicker. It also allows you to focus more on the horse.

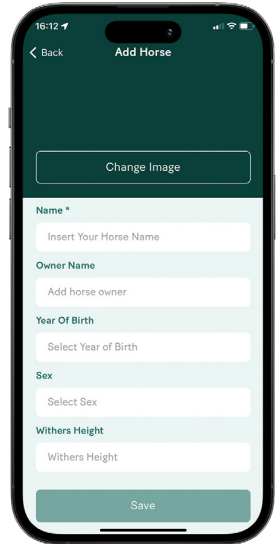

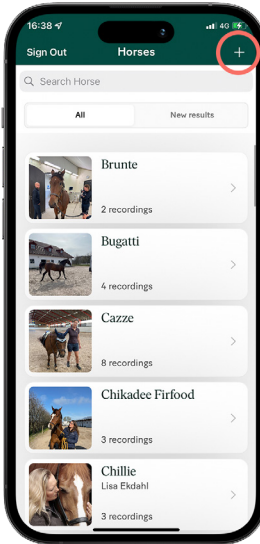

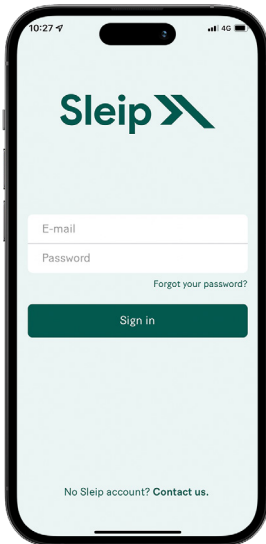

Setting up to record

- Set up in a well-lighted environment with a flat surface, outdoors or indoors
- Make sure there are no other horses in camera view
- Avoid strong direct sunlight in the camera
- Position the phone in landscape mode and at eye level

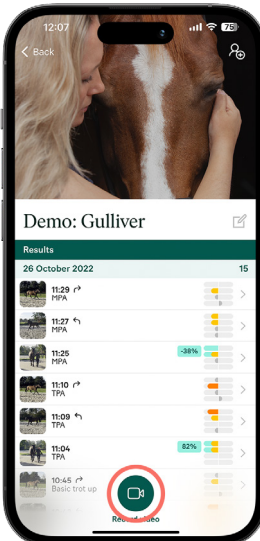

Preparing the horse

- Get the horse familiar with the environment
- Avoid environments where the horse can get distracted

Getting started with the Sleip app

- Sign in with your e-mail and password
- Select a horse from the list or press + to add a new horse
- Press Record video on the horse's profile page
- Select either straight line recording or longeing recording
- The app will switch to camera mode and you are ready to start recording

How to Sleep on a straight line

Trot the horse back and forth twice in the **same** recording.
Start just in front or right beside the camera.

- Press the red button to start recording
- Trot the horse away from the camera for about 30m (as for a visual exam)
- Turn the horse around and trot back towards the camera
- Repeat
- When the recording is complete, press the red button to stop and upload the video

The analysis is ready to view within a few minutes, depending on your internet connection.
You'll receive a push notification on your phone once it's done.

Keep in mind

- Maintain a steady trot
- Make sure the handler runs beside the horse and not in front of it
- Give the horse's head enough freedom to move
- Ensure that all the horse's limbs are visible throughout the entire recording

How to Sleip longeing

Longe the horse in two **separate** recordings, one for each direction.

- Longe the horse trotting for about 45 seconds in one direction
- Once you finish longeing in one direction, stop the recording and upload the video
- Turn the horse around and start a new recording while longeing in the other direction
- When the second recording is complete, press the red button to stop and upload the video

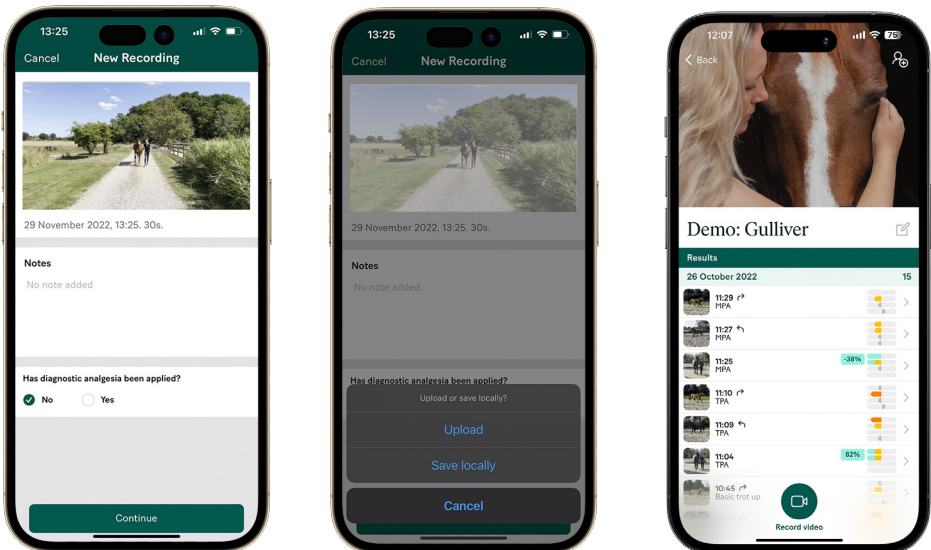

The analysis is ready to view within a few minutes, depending on your internet connection. You'll receive a push notification on your phone once it's done.

Keep in mind

- The diameter of the longeing area should be around 10 m for the best results
- The phone should be set up about 10m from the edge of the longeing circle to cover the longeing area and the horse entirely
- If you longe the horse in a bullet pen, make sure the fence is not in front of the camera
- Keep the entire horse in camera view. You may need to turn the phone slightly to follow the horse

Slow internet connection? Save locally and upload for analysis later.

If you have a slow internet connection, simply save the recording and upload it for analysis once you have better connectivity, as follows:

- When the recording is complete, press Stop and then Continue
- Choose to Save locally
- Locally saved recordings will appear in the horse's profile under Waiting for upload
- Upload for analysis once your internet connection allows
